## BINARY LAW of BACKGROUND RADIATION

© V.N. Poljansky \& I.V. Poljansky, 2004
The idea of this work had appeared in 2002. At mathematical simulation of processes of mechanical resonance in classical objects of the ring form we had confronted with inexplicable effect. The computer program "drew" the graph of the smooth function with periodically iterating peaks. This function features stability of own resonance oscillations of a ring and its graph should be look, as horizontal line. In reality, the graph looks like, as shown in fig.1.

Fig. 1
The graph of stability of resonance oscillations of a ring in program Mathcad 7 (on the abscissa axis is postponed oscillation frequency of a ring in terms of the frequency order)

This graph was made by means of program Mathcad 7, at the convergence tolerance of numeric rows $10^{-3}$. Recently we have executed same operation by means of program Mathcad 2001, but the obtained result is not better (refer to Fig.2).

Fig. 2
The graph of stability of resonance oscillations of a ring in program Mathcad 2001 (on the abscissa axis is postponed oscillation frequency of a ring in terms of the frequency order)

After data processing at the convergence tolerance of numeric rows $10^{-6}$, we have got the graph, as shown in Fig. 3 .

Fig. 3
The shape of graphs from the figs. 1 and 2 after data processing at convergence tolerance of rows $10^{-6}$
From above graphs follows, that the existent mathematical programs for computers cannot guarantee absolute accuracy at investigating of physical laws, which are describing with smooth functions. Improvement of convergence of endless row in 1000 times perfects accuracy of calculation of end function only in 5 times.
Our further examination of the atomic spectrums allows clearly recognize one more mathematical incident, which is artificially created defect of equations of quantum physics. The Napierian base ( $e=2.718281828459 \ldots$...), i.e. transcendental number figures in the equations of quantum physics. The transcendental number in any degree (except for zero) also is transcendental number.
Remind of, the base of natural logarithms is output computation of endless numeric row

$$
e=1+\frac{1}{1!}+\frac{1}{2!}+\frac{1}{3!}+\cdots+\frac{1}{n!}+\cdots
$$

For instance, at calculation of number $2^{8}=256$ through $\mathrm{e}=2.71828182845905$ with maximum accuracy of program Mathcad 2001, we have the following inaccuracy:

$$
\begin{gathered}
256-\mathrm{e}^{5.54517744447956}=+3.109 \cdot 10^{-15} \\
256-(2.71828182845905)^{5.5451774447956}=-6.883 \cdot 10^{-15}
\end{gathered}
$$

Hence, two disadvantage factors - computer and numeric, distort a mathematical interpreting of quantum processes along the scale of frequencies and can bring into fallacious deductions. In this paper we show examples of calculation of some spectral serieses of hydrogen and helium with the help of the polytronic equations and influence of aforesaid defects on accuracy of end results.
In the previous paper "On intercoupling of some physical constants" the formula for calculation of lengths of waves of radiation of atoms is represented, when the atom is in the state of maximal ionization.

$$
\begin{equation*}
\lambda_{p}\left(Z, m_{o}, m, n_{r}, n_{o}\right)=\frac{h \cdot c \cdot 10^{12}}{W_{t}\left(Z, m_{o}, n_{r}\right)-W_{t}\left(Z, m, n_{r}\right)+W_{t}\left(Z, m, n_{o}\right)} \quad|\mathrm{pm}| \tag{1}
\end{equation*}
$$

The energy $W_{t}\left(Z, m, n_{o}\right)$ represents background radiation from all objects, which are in a zone of experiment and which, by and large, influence the observations of sensors.
The relative amplitude (amplitude order) of background radiation $n_{o}$ shortens a wave of radiation on some picometers ( $\sim 10^{-3} \%$ ). Considering the fact, that measuring instruments ensure the accuracy in several hundredth shares of picometer, it is necessary to know a measure of description of background along frequency scale as possible more exactly.

The amplitude order $n_{o}$ of background depends on the frequency order $m$ and represents the binary function of a radiated frequency

$$
\begin{equation*}
n_{o}=n_{s} \cdot\left(2^{\frac{-m}{m_{s}}}\right) \tag{2}
\end{equation*}
$$

where $n_{s}$ - the integral amplitude order of a background in experiment;
$m_{s}$ - the long-wave frequency order of background radiation;
The radiant intensity of atoms is featured by the same law and represents probability of radiation, which corresponds to each quantum transition $m_{o} \rightarrow m$.

$$
\begin{equation*}
j=j_{n} \cdot\left(2^{\frac{-m}{m_{n}}}\right) \tag{3}
\end{equation*}
$$

where $j_{n}$ - the amplitude of intensity of emission of atom in limits of given spectral series, depending from choice of units of measurements;
$m_{n}$ - the short-wave frequency order of background radiation, depending on choice of units of measurements of intensity of resonance emission of atom;
In the table 1 the observable lengths of waves $\lambda_{p}$ and $\lambda_{q}$ and intensities $j_{p}$ and $j_{q}$ for ionized hydrogen $\mathrm{H}^{+}$- Lyman's series, are represented. These data are taken from NIST Atomic Spectra Database and Kelly Atomic Line Database.
First five lines in the table are shown as doublets. For rest lines "doubletness" is not shown, since the fission of lines is too small and cannot be measured. However, the fact of doubletness itself speaks about in the atom of hydrogen there are two oscillators of photons.

Table 1

| The Element <br> (ion) | $m_{o} \rightarrow m$ | $\lambda_{p}, \mathrm{pm}$ <br> (in vacuum) | $j_{p}$ | $\lambda_{q}, \mathrm{pm}$ <br> (in vacuum) | $j_{q}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{H}^{+}$ | $2 \rightarrow 4$ | 121566.82 | 1000 | 121567.36 | 500 |
| First series | $2 \rightarrow 6$ | 102572.23 | 300 | 102572.29 | 300 |
|  | $2 \rightarrow 8$ | 97253.68 | 100 | 97253.70 | 100 |
|  | $2 \rightarrow 10$ | 94974.30 | 50 | 94974.31 | 50 |
|  | $2 \rightarrow 12$ | 93780.34 | 30 | 93780.35 | 30 |
|  | $2 \rightarrow 14$ | 93074.80 | 20 | 93074.80 | 20 |
|  | $2 \rightarrow 16$ | 92622.60 | 15 | 92622.60 | 15 |
|  | $2 \rightarrow 18$ | 92315.0 | 10 | 92315.0 | 10 |
|  | $2 \rightarrow 20$ | 92096.3 | 9 | 92096.3 | 9 |
|  | $2 \rightarrow 22$ | 91935.1 | 7 | 91935.1 | 7 |
|  | $2 \rightarrow 24$ | 91812.9 | 5 | 91812.9 | 5 |
|  | $2 \rightarrow 26$ | 91718.1 | 4 | 91718.1 | 4 |
|  | $2 \rightarrow 28$ | 91642.9 | 3 | 91642.9 | 3 |
|  | $2 \rightarrow 30$ | 91582.4 | 3 | 91582.4 | 3 |
|  | $2 \rightarrow 32$ | 91532.9 | 2 | 91532.9 | 2 |
|  | $2 \rightarrow 34$ | 91491.9 | 2 | 91491.9 | 2 |
|  | $2 \rightarrow 36$ | 91457.6 | 2 | 91457.6 | 2 |

In Fig. 4 is shown the fission of lines of Lyman's series comparatively to ideal single oscillator of photons, lines of which are calculated under formula (1).
As evident from Fig.4, the accuracy of measurement of short-wave lines is of poor quality. But it is accepted to consider, that exactly these values of lengths of waves would be with coordination to the generally accepted theory.

Fig. 4
The fission of lines of Lyman's series into doublets
In the table 2 the observable lengths of waves $\lambda_{o}$ and intensity $j_{o}$ for double-ionized helium $\mathrm{He}^{++}$, and also length of waves $\lambda_{p}$ and intensities $j_{p}$, calculated with the help of the polytronic equations are represented.
Table 2

| The Element <br> (ion) | $m_{o} \rightarrow m$ | $\lambda_{o}, \mathrm{pm}$ <br> (in vacuum) | $j_{o}$ | $\lambda_{p}, \mathrm{pm}$ | $j_{p}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| He $^{++}$ | $2 \rightarrow 4$ | 30378.0 | 1000 | 30378.02 | 1000 |
| First series | $2 \rightarrow 6$ | 25631.7 | 300 | 25631.75 | 397 |
| $n_{r}=0.052854907$ | $2 \rightarrow 8$ | 24302.7 | 100 | 24302.72 | 158 |
| $n_{o}=0.0065 \cdot\left(2^{\frac{-m}{256}}\right)$ | $2 \rightarrow 10$ | 23733.1 | 50 | 23733.12 | 62.5 |
|  | $2 \rightarrow 12$ | 23434.7 | 30 | 23434.75 | 24.8 |
| $j=6350 \cdot\left(2^{\frac{-m}{1.5}}\right)$ | $2 \rightarrow 14$ | 23258.4 | 20 | 23258.44 | 9.8 |
|  | $2 \rightarrow 18$ | 23145.4 | 10 | 23145.41 | 3.9 |
|  | $2 \rightarrow 20$ | 23068.6 | - | 23068.57 | 1.6 |
|  | $2 \rightarrow 22$ | 23013.9 | - | 23013.91 | 0.6 |
|  | $2 \rightarrow 24$ | 22943.6 | - | 22973.64 | 0.2 |
|  | $4 \rightarrow 6$ | 164047.4 | - | 22943.10 | 0.1 |
| He $^{++}$ | $4 \rightarrow 8$ | 121517.1 | 50 | 164047.35 | 180 |
| Second series | $4 \rightarrow 10$ | 108497.5 | 30 | 121517.45 | 72 |
| $n_{r}=0.05285203$ | $4 \rightarrow 12$ | 102530.2 | 15 | 10253.76 | 28.34 |
| $n_{o}=0.0043 \cdot\left(2^{\frac{-m}{256}}\right)$ | $4 \rightarrow 14$ | 99239.1 | 8 | 99239.21 | 11.3 |
|  | $4 \rightarrow 16$ | 97213.8 | 6 | 97213.89 | 1.8 |
| $j=2900 \cdot\left(2^{\frac{-m}{1.5}}\right)$ | $4 \rightarrow 18$ | 95872.4 | 5 | 95872.44 | 0.7 |
|  | $4 \rightarrow 20$ | 94935.4 | - | 94935.40 | 0.3 |
|  | $4 \rightarrow 22$ | 94253.8 | - | 94253.80 | 0.1 |

The note. In the table 2 the data only for the first three series of radiation of ion of helium $\mathrm{He}^{++}$are represented. The data for the subsequent series in the reference literature either are absent, or are very poor and are inexact.

Table 2 (continuation)

| The Element <br> (ion) | $m_{o} \rightarrow m$ | $\lambda_{o}, \mathrm{pm}$ <br> (in vacuum) | $j_{o}$ | $\lambda_{p}, \mathrm{pm}$ | $j_{p}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{He}^{++}$ | $6 \rightarrow 8$ | 468700.0 | 30 | 468700.07 | 30 |
| Third series $_{n_{r}=0.05285164}$ | $6 \rightarrow 10$ | 320403.8 | 15 | 320403.72 | 15 |
| $n_{o}=0.00375 \cdot\left(2^{\frac{-m}{256}}\right)$ | $6 \rightarrow 12$ | 273411.8 | 12 | 273411.85 | 7.5 |
|  | $6 \rightarrow 16$ | 251197.4 | 9 | 251197.39 | 3.8 |
|  | $6 \rightarrow 18$ | 238614.3 | 7 | 238614.34 | 1.9 |
| $j=480 \cdot\left(2^{\frac{-m}{2}}\right)$ | $6 \rightarrow 20$ | 225339.9 | - | 230691.68 | 1 |
|  |  |  | - | 225339.91 | 0.5 |
|  |  |  |  |  |  |

The formula for calculation of lengths of waves of single-ionized helium $\mathrm{He}^{+}$has the padding term $W_{t}\left(Z, m, n_{p}\right)$, which takes into account the pumping of energy from the level $\mathrm{He}^{++}$into the level $\mathrm{He}^{+}$.
$\lambda_{p}\left(Z, m_{o}, m, n_{r}, n_{o}\right)=\frac{h \cdot c \cdot 10^{12}}{W_{t}\left(Z, m_{o}, n_{r}\right)-W_{t}\left(Z, m, n_{r}\right)+W_{t}\left(Z, m, n_{p}\right)+W_{t}\left(Z, m, n_{o}\right)} \quad|\mathrm{pm}|$
In the table 3 the observable lengths of waves $\lambda_{o}$ and intensity $j_{o}$ for single-ionized helium $\mathrm{He}^{+}$, and also length of waves $\lambda_{p}$ and intensities $j_{p}$, calculated with the help of the polytronic equations are represented.
Table 3

| The Element <br> (ion) | $m_{o} \rightarrow m$ | $\lambda_{o}, \mathrm{pm}$ <br> (in vacuum) | $j_{o}$ | $\lambda_{p}, \mathrm{pm}$ | $j_{p}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{He}^{+}$ | $2 \rightarrow 4$ | 58433.4 | 1000 | 58433.40 | 1000 |
| First series $_{n_{r}=0.04333303}$ | $2 \rightarrow 6$ | 53703.0 | 400 | 53703.01 | 397 |
| $n_{p}=0.03546$ | $2 \rightarrow 10$ | 52221.3 | 100 | 52220.86 | 158 |
| $n_{o}=0.012564 \cdot\left(2^{\frac{-m}{16}}\right)$ | $2 \rightarrow 12$ | 51561.6 | 50 | 51561.28 | 62.5 |
|  | $2 \rightarrow 14$ | 50999.8 | 35 | 51209.55 | 24.8 |
| $j=2520 \cdot\left(2^{\frac{-m}{1.5}}\right)$ | $2 \rightarrow 16$ | 50864.3 | 25 | 50999.59 | 9.8 |
|  | $2 \rightarrow 18$ | 50771.8 | 15 | 50864.14 | 3.9 |
|  | $2 \rightarrow 20$ | 50705.8 | 10 | 50771.65 | 1.6 |
|  | $2 \rightarrow 22$ | 50657.0 | 7 | 5065.66 | 0.6 |
|  | $2 \rightarrow 24$ | 50620.0 | 5 | 50619.94 | 0.2 |
|  | $2 \rightarrow 26$ | 50591.2 | 4 | 50591.17 | 0.1 |
|  | $2 \rightarrow 28$ | 50568.4 | 3 | 50568.36 | 0 |
|  | $2 \rightarrow 30$ | 50550.0 | 2 | 50549.98 | 0 |

The note. In the table 3 the data only for the first series of radiation of an ion of helium $\mathrm{He}^{+}$are represented. The calculation of the spectrums for the subsequent series is hampered by that circumstance, that in the reference literature there is no legible demarcation of spectrums in the series rank.

First two lines in the table $3\left(\lambda_{o}=58433.4 \mathrm{pm}, j_{o}=1000\right.$ and $\left.\lambda_{o}=537032.0 \mathrm{pm}, j_{o}=400\right)$ have a greater intensity and were measured with mountain-high accuracy. Near by them are situated the weaker lines $\lambda_{o}=59141.2 \mathrm{pm}, j_{o}=50$ and $\lambda_{o}=53889.6 \mathrm{pm}, j_{o} \sim 0$.
The graph in Fig. 5 shows, that first two lines in the table 3 are reduced taking into account their doubletness, whereas for following lines are brought average values of lengths of waves in the doublets.

Fig. 5
The calculation of first two lines of series taking into account their doubletness allows to define measurement mistake ( $\Delta \lambda_{i}=\lambda_{o}-\lambda_{p}$ ) for following lines and to find proper values of lengths of waves in the doublets

In the table 4 are brought two not identifying serieses of helium $\mathrm{He}^{+}$.
Table 4

| The Element (ion) | $m_{o} \rightarrow m$ | $\begin{gathered} \lambda_{o}, \mathrm{pm} \\ \text { (in vacuum) } \end{gathered}$ | $j_{o}$ | $\lambda_{p}, \mathrm{pm}$ | $j_{p}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{He}^{+}$ | $4 \rightarrow 5$ | 361467.25 | 3 | 361467.11 | 3 |

| $j=8000 \cdot\left(2^{\frac{-m}{1.5}}\right)$ | $4 \rightarrow 20$ | 355542.80 | 0 | 355542.73 | 0.8 |

## The conclusion

By means of polytronic equations it is possible to define a level of background in spectrums along the whole scale of frequencies.
